

## Meta - Optimization

Optimize the parameters of an optimization algorithm

## Performance Index

- \* Measures how efficient an optimization algorithm is
- \* Enables Meta-Optimization

Example of a performance index:

Chance of finding the optimum by performing  $m$  function evaluations

$$\eta = 1 - (1 - P_{\text{opt}})^{m/n_{\text{eval}}}$$

— allowed number of function evaluations

— mean number of required function evaluations

— chance of finding the optimum by performing ONE optimization
